P og alger

Strong correlations at
the base of the food web ...

Mest P, men et lite bidrag fra N

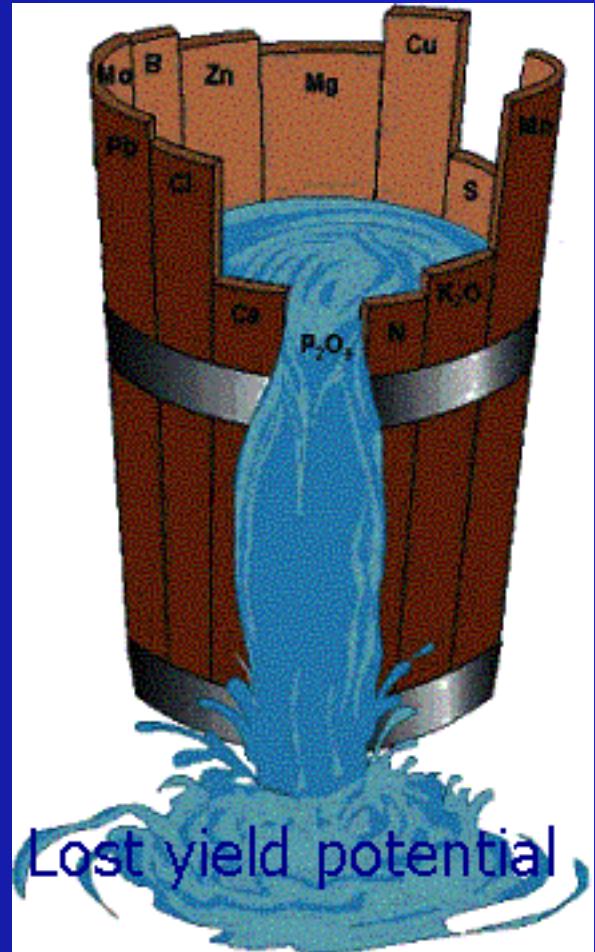

| | Scaled estimates | t Ratio | Prob > t |
|---|------------------|---------|-----------|
| Intercept | | 44.70 | <0.0001 |
| $\log_{10}(\text{alt})$ | | -2.72 | 0.0068 |
| $\log_{10}(\text{Ca})$ | | 3.06 | 0.0023 |
| $\log_{10}(\text{TP})$ | | 21.99 | <0.0001 |
| $\log_{10}(\text{TN})$ | | 3.97 | <0.0001 |
| $\log_{10}(\text{TP}) * \log_{10}(\text{TN})$ | | 4.45 | <0.0001 |

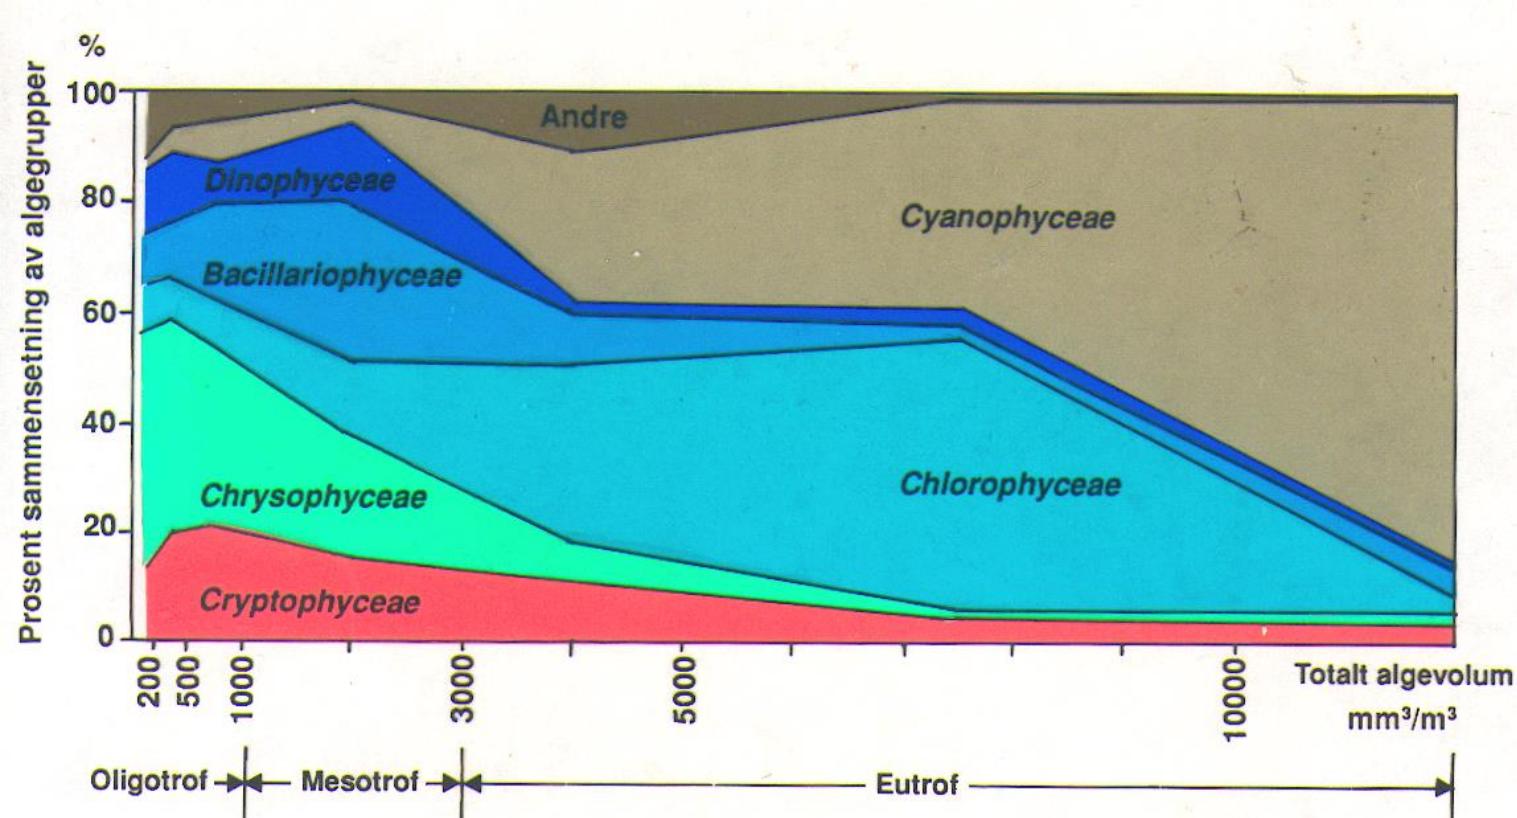

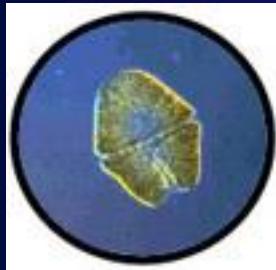

| | Scaled estimates | t Ratio | Prob > t |
|---|------------------|---------|-----------|
| Intercept | | 165.17 | 0.0001 |
| $\log_{10}(\text{alt})$ | | -4.61 | <0.0001 |
| $\log_{10}(\text{Ca})$ | | 8.27 | <0.0001 |
| $\log_{10}(\text{TP})$ | | 17.95 | <0.0001 |
| $\log_{10}(\text{TN})$ | | 2.23 | 0.0263 |
| $\log_{10}(\text{TP}) * \log_{10}(\text{TN})$ | | 2.76 | 0.0060 |

Liebigs minimums prinsipp

- One principally limiting element
- Often close to co-limitation
- Macro-nutrients vs. micro-nutrients
- Productivity vs standing stock: different elemental demands

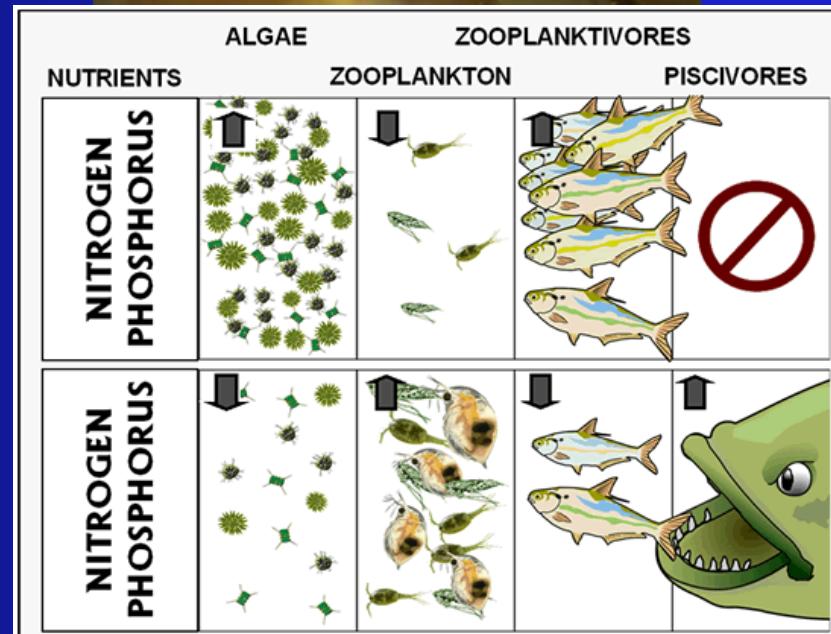

Endringer i phytoplankton samfunn, morfologi, beitbarhet og kvalitet

Samfunnsendringer og trofiske kaskader

- Typical shifts from large-bodied to small-bodied species
- Change from large cladocerans (*Daphnia*) to small copepods
- Reduced grazing pressure
- Shift from salmonids to cyprinids
- Importance of top predators and the trophic cascade

Increased

nutrient load

Increased algal mass
Algal community change

Increased pH
Hypolimnetic O₂ depletion

Increased fish density
Fish community change

Smaller zooplankton
Zoop. community change

Self-reinforcing eutrophication

Reduced grazing

P-release by fish

P-release from
sediments

Feedback 1

Tilfellet Gjersjøen ...

- Originally a oligotrophic lake
- Became eutrophic from the - 60ies due to increased P-loads
- Sewage plants were built but agricultural runoff continued
- Changes in fish and zooplankton communities, massive cyanobacterial blooms - poor water quality.
- Internal fertilization
- Pike-perch was added in 1980
- Roach vanished, conditions improved – a top-down story?

Hvorfor fungerte kaskaden i Gjersjøen?

- Fosfor (og N) var allerede kraftig redusert
- Mort spilte en avgjørende rolle for å opprettholde den interne P-gjødsling
- Rask og vedvarende effekt av utsetting av gjørs (1981)
- Umiddelbar skremseleffekt som fikk cyprinider til å skifte habitat (til littoral)
- Langvarig effekt ved økt bestand av gjørs
- Gjørsen kom på rett sted til rett tid!

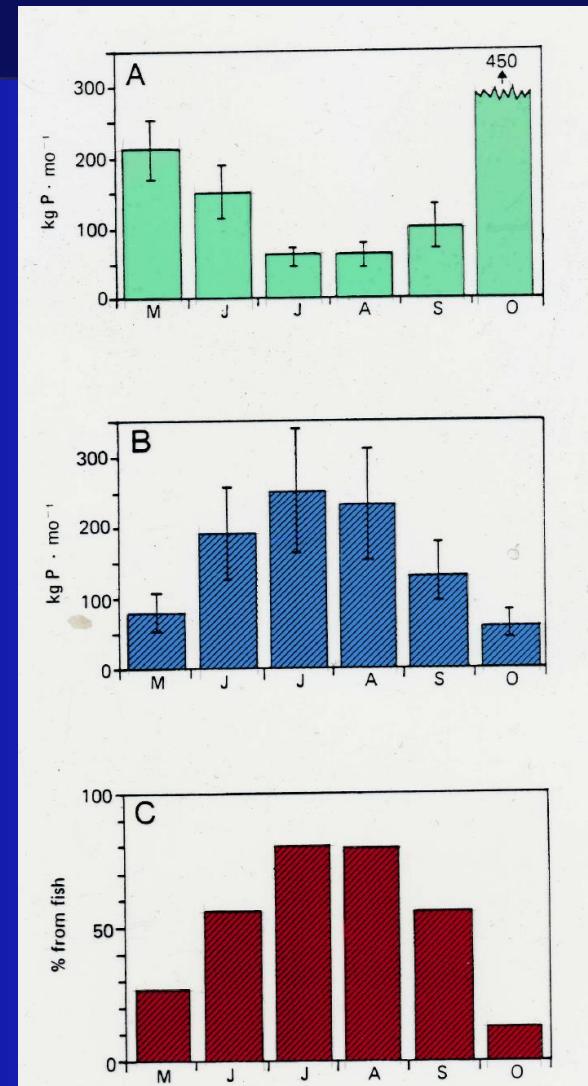

FIG. 4. Total phosphorus supply ($\text{kg} \cdot \text{mo}^{-1}$) to Lake Gjersjøen. Standard deviation is shown. (A) Estimated external loading of phosphorus from the tributaries. (B) Total release of phosphorus (SRP) from roach biomass in Lake Gjersjøen. (C) Percentage contribution of phosphorus from fish to Lake Gjersjøen.
